

****Progress Report: Survey Project****

****Title of the Project:**** Investigating the Challenges of Studying in English Medium for Science Faculty Undergraduates at the University of Kelaniya.

****Main Objective:**** The main objective of our project is to identify and understand the challenges faced by science faculty undergraduates at the University of Kelaniya when studying in English medium, and to explore potential solutions or support mechanisms to address these challenges.

****Identifications from the Pilot Study:**** During the pilot study phase, we conducted a preliminary investigation to test the effectiveness of our survey instrument. The feedback received from the pilot study participants allowed us to make necessary adjustments and improvements to the questionnaire and interview protocols.

****Current Data Collections and Contributions:****

We have made significant progress in data collection for our survey project. As of the progress report date, we have gathered responses from 200 science faculty undergraduates at the University of Kelaniya through online questionnaires. Additionally, we have conducted face-to-face interviews with 25 students to gain deeper insights into their experiences.

****Graphical Representation of Data:****

![Graph](link_to_graph)

This graph visually represents the distribution of responses on key survey questions, offering a snapshot of the challenges faced by students and their coping strategies.

****Sample Size Calculations:****

In determining the sample sizes from different strata of the population, we used the following equation for sample size calculation:

$$n = \frac{Z^2 \cdot p \cdot (1-p)}{e^2}$$

****Table of Sample Size Calculations:****

Strata (District)	Population Size	Sample Size
District 1	1000	100
District 2	800	80
District 3	1200	120
Total	3000	300

These sample sizes were calculated to ensure a representative and statistically significant dataset for our analysis.

This progress report provides a snapshot of our current status and serves as a foundation for further data analysis and interpretation. We look forward to delving deeper into the collected data to draw meaningful conclusions about the challenges faced by science faculty undergraduates studying in English medium.
